

Sudoku

Current functionality, controls and states · redesign inventory

Current purpose: a conventional generated 9×9 Sudoku with fast entry, optional notes and mistake feedback, a timer/score loop and app-wide visual themes.

Main Sudoku screen.

1. Entry and game structure

Difficulty sheet shown on first entry.

Generated Medium board.

Entry flow

- 1. Tap **Sudoku** on the hub.
- 2. Choose Easy, Medium, Hard or Expert.
- 3. A generated puzzle opens with score 0 and timer 00:00.
- 4. Leaving persists resumable progress; the hub can advertise Continue.

Visible area	Information/function
Header	Back to games, game menu, "Sudoku", and app theme control with current theme name.
Status row	Score, level and elapsed time.
Board	9×9 cells with given values, editable values, selection, peer highlighting and 3×3 boundaries.
Tool row	Notes/pencil mode, undo, redo and eraser.
Number pad	Digits 1–9 for the selected cell.

2. Control inventory

Control	What it does	Availability / state
Back to games	Leaves Sudoku and returns to the hub.	Always in header; current game is saved.
Game menu	Opens difficulty, Build Notes and mistake-feedback options.	Always in header.
Theme	Cycles/chooses among Classic, Dark, Pastel, Sunset, Sunrise, Ocean and Twilight.	Header; selected theme affects the broader app.
Board cell	Selects the destination for a digit/note; visual emphasis relates row, column and box.	Given cells cannot be edited.
Notes	Toggles candidate-note entry rather than final-value entry.	Applies to subsequent number taps.
Undo / Redo	Moves backward/forward through the edit history.	Disabled at the ends of history.
Erase	Clears the selected editable cell or its notes.	Needs an editable selection/content.
1–9	Writes a final digit or toggles a candidate according to Notes mode.	Needs an editable cell selection.
Difficulty choices	Starts a fresh generated puzzle at the chosen level.	Easy, Medium, Hard, Expert.
Show Mistakes	Controls immediate correctness feedback.	Menu setting.
Build Notes	Shows operator-facing release notes for the installed app version.	Menu action.

3. Menu and secondary states

Game menu over the live board.

State and feedback

- The selected difficulty is visible in both the status row and difficulty menu.
- Score increases through play; elapsed time is part of the session record.
- Optional mistake feedback can identify incorrect entries immediately.
- Completion presents a finished-game state and makes a new puzzle the next action.
- Undo/redo preserve intentional input history; notes and final values are distinct.

Accessibility and platform behavior

- Header and difficulty actions have explicit accessibility labels.
- The grid must communicate row/column/box context, givens, selection, notes and values without relying on colour alone.
- Keyboard size, one-handed reach and small candidate text are important device checks.

4. Product/design discussion prompts

Role in the product: Is Sudoku the familiar acquisition experience, the primary daily game, or simply one peer in a puzzle collection?

Score and time: Which behavior should the product reward—speed, accuracy, streaks, difficulty progression, or calm play?

Theme ownership: An app-wide preference currently lives inside this game. Should global appearance move to a shared settings surface?

Difficulty before play: Should first entry always block on a choice, remember the last level, or provide a daily/recommended puzzle?

Mistake model: Is immediate correctness feedback a learning aid, a setting, or contrary to the intended challenge?

Information density: Score, level and time compete with the grid; decide which are central to the future purpose.

Do not lose in redesign: notes versus final entry, immutable givens, undo/redo semantics, error visibility, board legibility, persisted mid-game state and a clear fresh-puzzle choice.
